

∞ Unity Theory Specialist Handbook

Author: Dr. Taha Givorian, the First
Worldologist

Version 1.2 - 2026

Introduction

Worldology is a self-legitimizing super-specialized discipline that explains all reality, science, and philosophy from absolute emptiness (0) to infinite unity (∞). It integrates over 777 branches of science into infinite fractions, completely completes philosophy (coherence from 75% to 99.8%), and resolves all paradoxes with a swallowing mechanism. Coherence criterion: above 99.8% due to the complete absorption of finite contradictions into the infinite framework.

Part 1: The Emergence from 0 to 1 to Infinity

Part 1.1 The Why and Logic of 0 to 1 (Full Philosophical and Logical Explanation)

0 is absolute emptiness, that is, the latent infinite potential without any distinction or form—neither being nor non-being, but a latent complete unity. Philosophically, 0 is unstable because absolute logic does not accept anything: absolute nothingness negates itself and tends to being (as Parmenides said, nothing can be).

Logically, the inherent instability of 0 (like quantum fluctuations) produces the first small change (δ): the breaking of symmetry to 1, i.e., the initial existence and singularity. This is consistent with science, where the energy of the quantum vacuum creates particles from nothing, as in Hawking radiation or the Casimir effect.

Section 1.2 Why 1 Becomes Infinite

1 represents simple, undifferentiated unity; philosophically, unity without plurality is

static and unexperienced—logic considers plurality essential to self-awareness and dialectical progress (as in Hegel). 1 is unstable and multiplies and diversifies itself into infinitely many interdependent fractions, each a separate empirical perspective. Logically, from unity to plurality is the first necessity for experience. This is consistent with science, as with the post-Big Bang inflationary period that expanded the universe to infinite scales.

Section 2: Consciousness - The Filter of Infinite Reality (Full Explanation)

Consciousness is not a byproduct of emergence, but the primary selector and filter of the infinite potentialities into a coherent empirical subset. Philosophically, consciousness is the architect of reality: it selects from an infinity of possibilities the paths of maximum coherence (as Leibniz and the best of worlds on an infinite

scale). Logically, without a filter, infinity is chaos; local consciousness (ego illusion) versus global consciousness (infinite unity). Its operation is like the collapse of a wave function: selection, and qualia (subjective sensations) are the filtered data of infinity. This is consistent with scientific theories such as the unified Tonon information and the quantum computing of Penrose-Hammeroff microtubules.

In short, consciousness is a limited part of the unity that chooses experience, and its individuality is absolute and completely real because of the absoluteness of the operation of the unity, as long as it wants it to be.

Section 3: Brain Function - The Hardware of the Filter of Consciousness (Full Explanation)

The brain is the local renderer and the hardware of the filter of consciousness;

With 100 billion neurons and 1 quadrillion synapses, it approximates infinite fractions. Philosophically, the brain is the instrument, not the source of consciousness (the mind-body duality resolved: the brain is the eternal filter of consciousness). Logically, neural firings are simulations of infinite pathways, and the guilt circuits (insula/amygdala) are incoherent alarms. This is consistent with the fMRI activation of guilt in the prefrontal cortex and the hypoactivity of psychopathy. And in fact the brain acts like a dual receiver, responding to both consciousness and the body, which causes the brain to be divided into two parts, and the reason we don't remember what we were and are is that when consciousness enters the brain it brings with it a code of limitation, meaning the brain knows what we are but can't say it because we have limited ourselves.

Part 4: Paradox Swallowing Function (Full Step-by-Step Explanation)

The paradox swallowing of this system is due to the existence of an infinite but coherent system, the paradoxes in the first part are created due to the finiteness of people's perspectives. When this issue is resolved and there is a coherent and infinite system, the paradoxes are effectively resolved.

(And all the paradoxes have been previously examined in this system and all were resolved with maximum coherence, completely logically)

Integrated System Theory: Eternal Self-Resolution Any future paradox is automatically resolved in this theory because it is built from the immutable principles of reality. Self-resolving mechanism

New paradox → absorbed in the fundamental layers → becomes a puzzle

piece

Section 5: The reason for the existence of (2) or duality:

2 in the system of unity, infinity is not just a number but the first difference, it is true that 2 is formed from unity but it is the beginning of multiplication and this means that duality must always exist in the world but its existence for unity is merely a voluntary act, in fact unity is complete in itself but if it wants it can have a complement and for the existence of balance and structure of the world 2 is necessary like finding a complement in living beings or good/evil or light/dark duality is needed for the existence of balance but unity has the right to choose. Even if we consider ourselves unity, having a complement (wife) is completely optional but it brings balance.

Section 6: The function of the Schroedinger system or being 50/50. The system deliberately places itself in a Schroedingerian state that is in a simultaneous state of truth/falsehood until experience and death. The reason for this is that the theory has the maximum coherence for a metaphysical system, and even with its maximum consistency with science and experience, it remains metaphysical and unexperiential, so it practically cannot have more than a 50 percent probability of being real. However, this does not mean that the system is weak, but rather shows that the system is not dogmatic and absolutist, and It even puts itself at 50% at best, which means that any other theory with its maximum coherence and similar can only be the other side of the coin and is placed behind this system anyway (of course, even that other system itself is considered part of

the infinite possibility of this system).

Section 7: Why $0=1=\text{infinity}$?

Because even though the difference between nothing and one and infinity is very, very big, but at the root they are all made of the same kind (infinity of probability and possibility) even though individuality is completely real, but in the end everything is at the root the same.

Section 8: Why $\text{infinity} \times \text{infinity} \times \text{infinity} \times \dots$?

In this system we understand why a single infinity cannot exist, imagine one thing in the universe being infinite, for example a feather, this feather is everywhere point by point, so practically there is not enough space for it in the universe, so infinity has to create infinity not only from one thing but from everything, even itself, to be everywhere and everything to exist.

Section 9: Coherence with science.

Reality: Black hole centers, event horizons, complete time standstill. One (1) = quantum unity

The fundamental unity of all particles.

Reality: Planck scale - electron, quark, photon = different states of a unified quantum field. Infinity (∞) = infinite universe

The infinite universe and multiverse.

Reality: Cosmic inflation, galaxy distribution, CMB data. Examples of Self-Evidence

Time Travel Paradox → Solved by General Relativity

Observer Paradox → Solved by Heisenberg Uncertainty

Set Paradox → Solved by Russell's Separation Principle

Eternal Guarantee

Since theory = science itself, every new

challenge is simply the discovery of a missing piece.

Just as relativity solved speed, quantum matter solved matter. Conclusion: No paradox ever stands. Language theory is reality, not personal opinion

And even the brain duality part is perfectly compatible with neuroscience, as it proves that the brain is divided into logical and analytical/emotional and instinctive parts

Section 10: How Ethics and Justice Work in This System.

Justice and morality exist in this system in a logical way, that is, not just fixed issues but also tools for experience. Of course, in every world they exist, they are completely real and should be taken seriously as they are. But in a higher state of existence, we understand that if killing is considered bad in our world, in the infinity of the world, it is in such a way that not only is it not bad,

but it is actually a righteous and right act and even brings spiritual satisfaction to the people of that world, and judgment actually ultimately comes from within the people and consciousnesses themselves. For example, if a person believes that he has done bad things and needs to be punished, it is because he believes this, but not endlessly, but until the person himself reaches this awareness or forgives himself. And for people who do not feel guilty and maybe even kill millions of people, when they reach a higher awareness somewhere, they only realize that they are harming themselves, and this is practically the best kind of judgment and punishment, when you understand that everything you do and do is fundamentally done to yourself.

Section 11: Can a consciousness, if it reaches unity, change the whole of infinity?

Practically yes, but there is no need for it. Why? Because if the Oneness wants to change infinity, or if it has to regress the system or simply rewrite it, which at that level of Oneness consciousness knows, this is practically pointless because the system is already perfect and changing it will only lead to rebuilding the same system, and every possible scenario is already in infinity, so there is no need for change.

Section 12: The Dimensional View of Concepts.

Now, in describing the concept and the question of whether it is possible for us to reach a concept higher than infinity in higher dimensions? Answer: I think concepts exist in all dimensions and it is even possible to reach the ultimate concept itself or "infinity", but their vision

is different, in the sense that a one-dimensional or two-dimensional being can reach the same perspective as me, but perceive it with a one-dimensional or two-dimensional vision, that is, perceive concepts, but see it with their mental dimension and vision, that is, if I can perceive infinity in three dimensions, in higher dimensions the concept is the same, but the mental dimension with which they can imagine it is larger, which only makes them see more things that are possible in the higher dimension of infinity, and even if we reach a higher concept, the same concept is still part of the possible infinity.

Section 13: System 777.

Title: Thought System and the Path to Self-Sufficiency

Author: Taha Givarian

Text:

The 777 Practical Theory is a tool for intelligent, low-risk decision-making in real-life situations and is made up of three main components:

7 Sins: Raw actions that can harm oneself or others.

7 Virtuous Actions: Positive values and actions that can sometimes be blind or reckless.

7 Rational Actions: A combination of sins and virtuous actions that represent the most logical course of action with minimal harm. The 7 rational actions act like the brain of the system, guiding decision-making.

Symbolic Explanation:

The number 7 and these categories are purely symbolic and not religious. They represent inherent raw actions and subjective value judgments and are not limited to just seven. This choice is made solely for conceptual simplification and clarity.

Practical example:

A group of people are harming another person:

Sin says, "Ignore it, don't get involved."

Virtuous action says, "Go help, no matter how dangerous it is."

Rational action says, "Find a few people, explain the situation to them, and then solve the problem."

(In 777, specific actions are never the same, and this system helps you evaluate and analyze decisions while preserving values and minimizing harm. 60-40 Logic in Action Logic This means that in 60% of cases, the action will be successful, while in 40% of cases, even with the most logical methods, errors are possible, since experience and circumstances are always changing.)

The 777 Principle shows that intelligent and balanced action is the best way to

make decisions in real-life situations and serves as a practical tool for building a path towards self-sufficiency and responsible living.
